DETAILED ACTION

1. Regarding claims 1-10, the claims describe a network logical interface for a client-server environment providing exclusionary responses from the server. The breadth of the claims is not inclusive to behavior responses from the server as currently assumed; that is the claims are interpret to dictate the functionary of multiple server responses to a file retrieval or storage request not simply to a single response meeting the claim as stated. Thompson disclosed the use of network enabled and connected mass storage device (memory segment), which provided a read-only cache (See inter alia, Fig. 5 and 6, and Col. 12, lines 40-58). This memory segment was enabled as write one read many, and non-volatile and volatile RAM. Thompson further specifically dealt with backup functionality, provided access to network stored information files in response to client requests (See inter alia Col. 2, lines 18-22). Thompson does not explicitly disclose server specific response in the situation that files not found in specific cache. However, in the same field of endeavor, Horvig discloses server response functionality to a general file access methodology set forth in Thompson, including situations where a file is not found or distributed or specific cache type was utilized. It would have been obvious to one of ordinary skilled in the art at the time of the invention was made to incorporate theses advance teaching of file management and file locking provided by Horvig in a network file access such as Thompson in order to increase efficiency of the networking system (See Horvig, Col. 3, lines 55-61 and Thompson fig 5-7).
